1. INTRODUCTION

1.1 Terms of Reference

The purpose of this semi-annual monitoring report is to present the results obtained between November 1, 2002 and October 20, 2006 of the Landfill Bioreactor Project at the King George Recycling and Waste Disposal Facility (King George Landfill) in King George County, Virginia. It is anticipated that this will be the final semi-annual monitoring report. It should be noted that no leachate has been added during the second half of 2006. The bioreactor study is being performed by Waste Management of Virginia, Inc. (WMVA) under the United States Environmental Protection Agency's (USEPA's) Project XL program. This monitoring report was prepared for the Virginia Department of Environmental Quality (VDEQ) by Mr. Douglas T. Mandeville, P.E., and was reviewed by Mr. Thomas B. Ramsey, P.E., both of Geosyntec Consultants (Geosyntec), in accordance with the internal peer review policy of the firm. This report describes the monitoring activities between the above-mentioned dates as well as broad conclusions regarding the entire 4 year project.

1.2 Project Overview

The King George Landfill is located in King George County, Virginia, approximately 50 miles north-northeast of Richmond, Virginia. The waste disposal area will cover approximately 290 acres upon completion. Construction of the first cells started in 1996 and construction of additional liner area has been performed every year since. The King George Landfill was constructed having a geomembrane composite double-liner system, with primary leachate collection and leak detection (secondary collection) layers. The configuration of Cells 1 through 4 is shown in Figure 1. As part of the XL program, Cell 3 is operated as a bioreactor (i.e., leachate is recirculated), whereas Cells 1, 2, and 4 are operated as standard landfill cells (i.e., no leachate is recirculated). Cell 3 of the King George Landfill is referred to as the test area. Cells 1, 2, and 4 are referred to as the control area.

A landfill is said to be a bioreactor when leachate and other liquids are added to the landfill to raise the moisture content of the waste to a value near its field capacity. The original intent of the XL program was to recirculate all of the leachate generated at the site, plus an additional amount of non-hazardous liquids. The goal is to recirculate between 7 million and 8 million gallons of leachate and other non-hazardous liquids per year. This is approximately twice the typical leachate generation rate at King George

Landfill. WMVA sought to recirculate this amount, while maintaining compliance with applicable rules and regulations. At the time when the program was initially implemented in November 2002, an increase in the occurrence of leachate seeps was observed, causing site personnel to reduce or curtail recirculation operations. As a result of the observed increase in leachate seeps, in the interest of maintaining good landfill operating practices and complying with environmental protection regulations, the actual amount of leachate recirculated was substantially less than 8 million gallons per year. The amount of liquid applied to the waste varied based on site inspections and observations.

It was anticipated that the operation of Cell 3 as a bioreactor would result in several environmental and cost saving benefits including, but not limited to, the following: (i) decreased leachate management costs; (ii) increased waste density in the landfill; (iii) reduced period of landfill gas generation; and (iv) improved long-term leachate quality. These benefits are discussed in depth in WMVA's Project XL application [Geosyntec, 2000].

The performance of the landfill is evaluated based on measurements of critical chemical and physical parameters associated with the solids, liquids, and gasses obtained from the test and control areas. Parameters that were measured include settlement, leachate quantity, leachate quality, in-place density of waste, and air quality. The parameters measured in the bioreactor (i.e., test area) have been compared to similar parameters measured from the control area.

1.3 Report Organization

In this report, the results of the analytical tests conducted during 2006 as well as a summary of the project as a whole are provided. The organization of this report is described below.

- Section 2 addresses the Federal Register site-specific rule making.
- Section 3 presents the requirements of the VDEQ Experimental Permit.
- Section 4 describes the sampling and sampling and analysis activities performed during this reporting period.
- Section 5 describes the analytical test results and other data collected during this reporting period.

- Section 6 presents summary comments.
- Section 7 provides references.
- Appendix A presents the leachate laboratory analysis results.
- Appendix B presents the liquid application logs (a daily and monthly liquid application summary is presented in Table 7).
- Appendix C presents settlement data.
- Appendix D presents landfill gas data.
- Appendix E presents groundwater quality compliance data.

2. REQUIREMENTS OF FEDERAL REGISTER SITE SPECIFIC RULE MAKING

On July 18, 2002, the EPA promulgated a site-specific rule to implement this project under the USEPA's Project Excellence and Leadership Program (Project XL). This rule was published in the Federal Register and provides site-specific regulatory flexibility under the Resource Conservation and Recovery Act (RCRA) for the King George Landfill. Part 258, Subpart D of the rule identifies 14 conditions that are to be met while leachate is recirculated at the King George Landfill. The remainder of this section addresses 12 of these conditions; the last two conditions are related to the duration of and compliance with the site-specific rule.

- 1) *Item 1 relates to the integrity of the liner system and maintaining less than 30 cm of head on the liner system.* In accordance with Item 1, the integrity of the liner system was maintained during construction of the recirculation trenches and the leachate collection system has been maintained in good operating order. The design calculations [Geosyntec, 2000] showed that up to 7 to 8 million gallons of liquid per year could be added to the waste mass and that the head on the liner system would remain less than 30 cm. Additionally, the leachate collection system was designed to operate such that the leachate removal pumps turn on before the head acting on the liner system reaches 30 cm. On February 22, 2006, during routine daily inspection of the leachate sump houses, facility staff observed the visual high level alarms indicating a head exceedence on the liner system. This exceedence occurred in Cells 2, 3, and 4 of the landfill. Cell 3 is the test area at King George, Cell 2 is located immediately west of the test area and Cell 4 is located immediately east of the test area. In accordance with the facility permit, site personnel informed the VDEQ Northern Virginia Regional office of the exceedence and increased the rate of leachate removal from the sums as well as the off-site trucking frequency in an effort to reduce the head level to below the 30 cm regulatory limit. The leachate levels were below the regulatory limit on February 28, 2006 in Cell 2, on March 1, 2006 in Cell 3, and on March 4, 2006 in Cell 4. It is important to note that no leachate had been recirculated in the test area since 6,000 gallons were added in October 2005. Prior to the October 2005 event, the most recent recirculation event was approximately 13,000 gallons in June 2004. It is possible that leachate added to the test area during the initial phases of the XL project had finally traveled through the waste mass to the leachate collection system. At this time, it is not possible to determine if this

in fact was the cause for this event. While Cell 3 is the permitted bioreactor area, Cells 2 and 4 are designated as control areas with no liquid addition. This indicates that the problem that occurred was not specifically limited to the bioreactor area.

The average annual liquid application rate based on data between November 1, 2002 and June 30, 2006 was approximately 689,822 gallons. The leachate collection records in the test and control areas have not indicated an increase in the leakage rate through the primary liner system into the secondary collection system.

With regard to maintaining the integrity of the liner system, there are no apparent signs of slope movement based on daily observations at the site.

- 2) *Item 2 relates to the Code of Federal Regulations (CFR) Section 258.40.* In accordance with Item 2, the groundwater quality for this reporting period has been monitored and analyzed at the compliance point. This analysis was performed by Joyce Engineering, Inc. (Joyce Engineering); a copy of the letter is presented in Appendix E. Arsenic, Cadmium, and Lead have been detected at concentrations that exceed the current MCL; however, it is noted that the detected concentrations were less than the facility background concentrations at the time of detection. Joyce Engineering determined that the concentrations were not statistically significant. As per VDEQ, the monitoring program at the King George Landfill, Permit No. 586, was allowed to continue in the Detection Monitoring Program.
- 3) *Item 3 relates to the occurrence of seeps at the landfill.* Surface seeps have previously occurred at the King George Landfill following initial leachate recirculation operations in late 2002 and early 2003. These seeps were short in duration and were repaired quickly. These seeps were most likely attributed to the leachate recirculation operations at the site. In accordance with Item 3, WMVA is in the process of identifying operating procedures that minimize the occurrence of seeps. Because WMVA operates the King George Landfill in an environmentally responsible manner, it was decided to temporarily halt liquid application until a suitably revised operating program could be developed and put into practice. For this reason, no liquid was applied to the landfill during the current reporting period. As a result, the average annual amount of leachate recirculated at the landfill has been less

than the target amount of 8 million gallons. During the current reporting period, no leachate seeps were observed at the King George Landfill.

- 4) *Item 4 relates to the leachate quality parameters to be analyzed as part of this project.* In accordance with Item 4, the evaluation of the key leachate quality parameters occurred at the frequency presented in the Final Project Agreement [Geosyntec, 2000] and the permit application for leachate recirculation submitted to VDEQ [Geosyntec, 2001]. The test results are discussed in Section 5.1. It should be noted that these parameters (or groups of parameters) have been analyzed in leachate samples collected from the test and control areas. Appendix A includes a summary of the leachate parameters that exceeded the MCL or were detected at concentrations above the method detection limit. A complete set of laboratory results is available upon request.
- 5) *Item 5 relates to the quantity of leachate applied to the test area and the amount of leachate collected in the test and control areas of the landfill.* No leachate or other liquid was applied to test area at King George Landfill during the current reporting period. The quantities of leachate collected from the test and control area are discussed in Section 5.1.
- 6) *Item 6 relates to an initial characterization of the liquid that was added to the test area.* An initial characterization of the leachate added to the landfill was performed in September 2002. The results of this analysis indicate that the leachate is an acceptable liquid to add to the landfill. Note, however, that no leachate or other liquid was applied to test area at King George Landfill during the current reporting period.
- 7) *Item 7 relates to the occurrence of landfill fires in the test area and the measurement of gas temperature at the wellheads.* The test area at King George Landfill has been operated in a manner to prevent landfill fires from occurring and none have been observed during the project. The gas temperature at the wellheads is discussed in Section 5.2.
- 8) *Item 8 relates to topographic surveys at the site.* As shown in Table 1, two topographic survey events were scheduled during the current reporting period. However, no survey data were available for inclusion in this report. The results of previous surveys are presented in Table 8.

- 9) *Item 9 relates to odor complaints resulting from liquid application events.* No odor complaints were reported at King George Landfill during the reporting period.
- 10) *Item 10 relates to an initial waste characterization in the test area of the landfill.* A total of five borings were drilled in the summer of 2001. Two of these borings were in the control area and three were in the test area. In accordance with the Final Project Agreement [Geosyntec, 2000] and the permit application for leachate recirculation submitted to VDEQ [Geosyntec, 2001]. Additional borings were drilled in November 2003 and December 2004.
- 11) *Item 11 relates to the preparation of semi-annual reports to the EPA Regional Administrator.* Previous monitoring reports were submitted on 8 May 2003, 17 July 2003, 19 January 2004, 18 July 2004, 18 January 2005, 18 July 2005, 18 January 2006, and 18 July 2006. This is the final semi-annual monitoring report for the King George XL project.
- 12) *Item 12 relates to additional landfill gas monitoring.* The monitoring requirements for the New Source Performance Standards and the Title V Air Permit for the site were met during the reporting period. The wellhead monitoring logs and the surface scan results are presented in Appendix D.

3. REQUIREMENTS OF VDEQ EXPERIMENTAL PERMIT

On October 20, 2002, the state issued a permit modification allowing bioreactor operations in Phases 1 and 2 at the King George Landfill. Permit Module I.F. of the permit amendment issued October 20, 2002, identifies several site-specific conditions that must be met while leachate is recirculated at the landfill. The remainder of this section addresses each of these conditions.

- 1) *Item I.F.1 relates to the issuance of a Certificate to Operate.* Construction of the liquid application trenches was completed within 180 days of the issuance of the permit amendment. The current experimental permit has expired. At this time, WMVA does not anticipate submitting a permit amendment application to continue bioreactor operations at King George.
- 2) *Item I.F.2 relates to the expiration of the experimental permit and request for a full permit amendment.* This report presents the data obtained through 2006. Because of the problems that have been encountered at this site with adding leachate to the test area WMVA anticipates submitting a formal request to withdraw from the Final Project Agreement for the XL project.
- 3) *Item I.F.3 relates to the permitted landfill bioreactor area, Phases 1 and 2.* In accordance with the permit requirements, the liquid application trenches were constructed in Cell 3, and liquid was applied only in this part of the landfill.
- 4) *Item I.F.4 relates to the monitoring, sampling, and reporting requirements.* In accordance with Item I.F.4, the monitoring was completed as identified in Permit Attachment IIB-2. Previous monitoring reports were submitted in May 2003, June 2003, September 2003, January 2004, July 2004, January 2005, July 2005, January 2006, and July 2006.
- 5) *Item I.F.5 relates to the Title V Air Permit Issued January 10, 2002 and the New Source Performance Standards Subpart WWW.* In accordance with Item I.F.5, WMVA complied with the regulations identified in the Title V Air Permit and the New Source Performance Standards Subpart WWW.
- 6) *Item I.F.6 relates to managing leachate as a hazardous waste if the characterization of leachate indicates that it is hazardous in accordance with the Virginia Hazardous Waste Management Regulations (9 VAC*

20-60-10). (It should be noted that leachate is not explicitly listed as a hazardous waste in the Virginia Hazardous Waste Management Regulations). The laboratory results for the leachate samples obtained in March 2006 indicate that the leachate at King George Landfill is not a hazardous waste.

- 7) *Item I.F.7 relates to the monitoring of leachate head over the liner at its lowest disposal point to ensure that no more than 1 foot of head of leachate accumulated over the liner.* The issue of hydraulic head acting on the liner system is addressed in Section 2, Item 1.
- 8) *Item I.F.8 relates to the closure of the bioreactor landfill area.* At this time, WMVA plans to continue bioreactor operations in Cell 3 at King George Landfill. In accordance with Item I.F.8, WMVA will notify VDEQ at least 180 days prior to the anticipated date of closing.

4. MONITORING PROGRAM AND SAMPLING AND ANALYSIS ACTIVITIES

4.1 Monitoring Program

Project XL monitoring activities at the King George Landfill consist of documenting the quality and quantity of leachate, landfill gas, and solid waste in the test and control areas. A detailed description of the monitoring activities for the Project XL Program is presented in the document entitled, “*Monitoring, Sampling, and Analysis Plan*” (Monitoring Plan) [Geosyntec, 2001], which is contained in the permit application submitted to VDEQ. As part of the USEPA XL program and VDEQ permit requirements, a series of site-specific rules and monitoring requirements have been developed. The USEPA site-specific rule appeared in the Federal Register on July 18, 2002; compliance with these requirements was addressed in Section 2 of this report. The VDEQ site-specific permit requirements appeared in the state permit modification issued for the site on October 20, 2002; compliance with these requirements was addressed in Section 3 of this report. Table 1 shows the monitoring events that were scheduled during 2006; Table 2 summarizes the dates and sampling events that have occurred to date.

Leachate monitoring events include collecting leachate samples from the control area and the test area for subsequent laboratory analysis. Landfill gas monitoring events include measuring landfill gas composition at the wellheads in the control and test areas, obtaining landfill gas composition samples from the headers of the landfill gas collection system, and performing a surface scan to measure surface emissions. The solid waste monitoring event includes obtaining waste samples for subsequent analysis. In addition to these field monitoring events, leachate generation volumes, liquid application volumes, and landfill settlement are monitored.

The purpose of the monitoring program is to evaluate the performance of the landfill bioreactor throughout the duration of the project. The evaluation is based on the following performance criteria:

- leachate quality and quantity;
- landfill gas quality and quantity; and
- solid waste decomposition/stabilization.

The manner in which these criteria are evaluated is described in the following three subsections.

4.1.1 Leachate Quality and Quantity

Sampling activities are conducted in both the test area and control area. Leachate sampling was conducted in Cells 1, 2, 3, and 4, and at the leachate storage tank, according to the frequency described in Table 1. Leachate samples are collected by filling the appropriate sample bottles directly from the sampling ports from the primary leachate collection system for the respective phase being sampled. The sampling ports for each of the primary leachate collection systems are located within the vault/riser house of the leachate collection system for each phase. The specific parameters measured, and the associated test methods, are provided in Table 3. Key parameters that identify the presence of biological processes in the landfill have been identified and include: (i) Biological Oxygen Demand (BOD); (ii) Chemical Oxygen Demand (COD); (iii) Total Organic Carbon (TOC); (iv) Chloride; (v) Sulfate; (vi) Nitrate as Nitrogen; and (vii) Ammonia as Nitrogen (Pohland and Harper, 1986). From these indicators, a qualitative inference can be made regarding the degree of organic composition of landfill wastes.

In addition to evaluating the leachate quality in the landfill over time, the amount of liquid added to the leachate recirculation trenches and the amount of leachate collected in the leachate collection sumps was recorded.

4.1.2 Landfill Gas Quality and Quantity

Measurements of landfill gas quality are obtained from composite gas samples of the landfill gas collection system. The parameters measured and the test methods for the landfill gas monitoring and sampling are described in the Monitoring Plan [Geosyntec, 2001]. The non methane organic compounds (NMOCs), gas samples were obtained in accordance with the requirements of USEPA Method 25 and samples obtained for volatile organic compounds were obtained in accordance with USEPA Method TO-14.

Landfill gas monitoring is performed at each of the existing landfill gas wells to monitor activity within the test and control areas. Measurements of methane (CH_4), oxygen (O_2), carbon dioxide (CO_2), temperature, and flow rate were obtained from each gas well using portable field instruments, (i.e., a Landtech, Inc., GEM 500). Hydrogen sulfide (H_2S) measurements were obtained using a GasTech GT-2 Hydrogen sulfide detector.

Surface emissions monitoring is performed in accordance with the requirements specified by the New Source Performance Standards (NSPS) and Emissions Guidelines (EG) for MSW landfills [40 CFR 60.755]. Methane concentrations were measured within 5 to 10 centimeters (2 to 4 inches) from the landfill surface in the test and control areas.

4.1.3 Solid Waste Decomposition/Stabilization

To evaluate the degree of decomposition of the solid waste, a series of borings are periodically drilled in the test and control areas. Solid waste samples obtained from these borings are evaluated for: (i) moisture content; (ii) cellulose; (iii) lignin; (iv) pH; and (v) biochemical methane potential (BMP). The moisture content is the percentage of water that is present in the waste. Cellulose is the portion of the volatile solids that will degrade over time; lignin is the portion of the volatile solids that will not degrade. Biochemical methane potential is a measure of how much methane the waste may generate.

A secondary means of evaluating waste decomposition is to measure waste settlement in both the test area and the control area. Topographic surveys of the test and control areas are conducted on a quarterly basis and the cumulative settlement is analyzed.

4.2 Sampling and Analytical Activities

The overall monitoring and sampling program was implemented by Geosyntec personnel with sampling performed by Joyce Engineering and WMVA site personnel.

4.2.1 Leachate Quality

Leachate samples from the test and control areas were obtained by Joyce Engineering on the dates presented in Table 2. The leachate samples were collected from sumps in Cells 1, 2, 3, 4, as well as the leachate storage tank. The leachate samples were collected using the field sampling procedures described in the Monitoring Plan contained in the permit application for leachate recirculation at the site [Geosyntec, 2001].

Leachate samples were analyzed by Severn Trent Laboratories, Inc. and were tested for the parameters listed in Table 3. A summary of the leachate parameters that exceeded the MCL or were detected at concentrations above the method detection limit is provided in Appendix A. Analytical results for the key parameters identified in Section 4.1 are presented in Table 5. Also presented in Table 5 are test results for the parameters listed in the Federal Register site-specific rule (i.e., wet chemistry parameters, heavy metals, and common ions). The test results for the organic priority pollutants are not anticipated to indicate the overall performance of the test area and are not presented in Table 5. Section 5.1 of this report discusses the leachate quality data.

4.2.2 Landfill Gas Quality

The landfill gas samples were collected using the procedures described in the Monitoring Plan contained in the permit application for leachate recirculation at the site [Geosyntec, 2001]. The landfill gas samples from the header pipes in the landfill gas collection system were sent to Severn Trent Laboratories, Inc. for laboratory analysis. These landfill gas samples were tested in accordance with USEPA method TO-14. Copies of these results are presented in Appendix D. The landfill gas composition at the wellheads in the test and control areas was monitored for temperature, flow rate, and concentration of methane, carbon dioxide, and oxygen (percent by volume). These results are summarized in Table 4 and discussed in Section 5.2.

4.2.3 Solid Waste Sampling

Prior to construction of the leachate recirculation system, a series of exploratory borings were drilled in both the test and control areas. Samples of solid waste were collected from a variety of depths at each boring location. Solid waste samples were obtained from five locations in November 2003 and again in December 2004. The solid waste samples collected during the field activities were sent to Virginia Tech and were analyzed for moisture content, lignin, cellulose, pH, and BMP. The results from the initial background samples as well as the November 2003 and December 2004 events are discussed in Section 5.3.

4.3 Other Data

4.3.1 Leachate Generation Quantities

Leachate flow was measured bi-weekly from the test area (Cell 3) and the control area (Cells 1, 2, and 4) by site personnel using flowmeters that are installed in the leachate riser vaults near each cell. The leachate generation quantities for each cell are presented in Table 6.

4.3.2 Quantity of Liquid Applied to Landfill

The amount of liquid added to each trench since November 2002 has been recorded by site personnel. No leachate has been added during the last two reporting periods. The trench configuration is shown in Figure 1. A summary of all liquid quantities added to the test area to date is presented in Table 7.

4.3.3 Landfill Settlement

A series of topographic surveys of the test and control areas has been performed by Flora Surveying. An approximately 100-ft grid system was established, with the elevation measured at the same locations over time. A summary table containing the point identification number, northing, easting, elevations for the survey data collected during 2004 and 2005, and calculated point settlement between survey events is presented in Table 8.

5. DATA ANALYSIS

5.1 Leachate Quantity and Quality

Liquid application at the King George Landfill began on November 1, 2002. No leachate has been added to the test area since October 2005. Figure 2 presents the cumulative liquid application volume versus time and the collected leachate volume. For reference, the target liquid application rate of 7 million to 8 million gallons per year (583,300 to 666,700 gallons per month) is also shown on Figure 2. It is important to note that during filling of landfill Cells 1 through 10, coal fly ash from a nearby power facility was accepted at King George at rates of up to 400 to 600 tons per day. This fly ash was used as an alternative daily cover material. Horizontal layers of fly ash were observed in the landfill during the solid waste sampling events. These horizontal layers may be acting as impermeable layers and contributing to the reduced infiltration rates for the trenches that have historically been observed at King George. This has impacted the site's ability to recirculate leachate.

To date, a total of approximately 2,876,464 gallons of leachate have been applied at King George Landfill.

Table 9 shows the average monthly precipitation, 2006 monthly precipitation, and the departure from normal (data is for Falmouth, Virginia). Through December 31, 2006, the geographic region in which the landfill is situated received approximately 33.47 inches of rain, which is 8.96 inches less than the historical average for a one year period.

The total amount of leachate collected in the test and control areas since November 2002 is 3,017,620 and 14,123,590 gallons, respectively. All of the leachate generated between January 1, 2006 and October 20, 2006 was sent off-site for treatment.

In examining Figure 2, there does not appear to be a correlation between the amount of liquid applied to the landfill and the amount of leachate collected in the leachate collection system. The figure also shows that the rate of leachate generation from both the test and control areas was consistent with that of previous years.

Figures 3 through 8 show temporal variations in the BOD:COD ratio and COD:TOC ratio in leachate as well as the concentrations of chloride, nitrate nitrogen, ammonia nitrogen, and pH. These figures represent the key leachate parameters identified in Table 5. To date, it has not been possible to clearly identify consistent

trends in the data nor significant differences between leachate data from the test and control areas. It should be noted that the analyses of the background leachate quality samples (dated September 27, 2002) were within typical ranges for landfill leachate. As previously reported, the biological oxygen demand (BOD) concentration of the leachate samples continues to be indicative of lower bound values for typical landfill leachate. Table 5 shows a range between approximately 40 mg/l and 3,300 mg/l; typical values range from 20 mg/l to 35,000 mg/l [Kjeldsen et al., 2003].

Additional data related to the leachate quality test results is presented in Appendix A. The tables in Appendix A summarize detected leachate parameters and highlight those that exceed the MCL or method detection limits.

5.2 Landfill Gas Quality and Quantity

Table 4 summarizes monthly variations in composition and temperature of landfill gas (LFG) measured at selected wellheads located within the test and control areas at the King George Landfill. No additional LFG data were collected during the current reporting period. The temperatures measured at the wellheads have been historically less than 140 degrees Fahrenheit; this indicates that there were no landfill fires within the test or control areas.

Historic trends in the LFG flow rates at each wellhead are shown in Figure 9. No additional flow rate data were collected during the current reporting period. None of the data presented in Figure 9 show consistent behavioral trends.

Figure 10 shows the percentage of methane in LFG at the wells in the test and control areas. With the exception of Well GW-15 in the control area, the concentration of methane present in LFG at all sampled wellheads had remained relatively consistent over a period of 12 - 15 months at about 50 percent. At this time, therefore, there does not appear to be a clear difference between LFG methane concentrations in the test and control areas.

Figure 11 shows the percentage of carbon dioxide in LFG at the wells in the test and control areas. Again, with the exception of Well GW-15, the concentration of carbon dioxide in LFG at all sampled wellheads had remained relatively consistent over a period of 12 to 15 months at 30 to 40 percent.

5.3 Solid Waste Analysis

Solid waste samples were previously obtained from the test and control areas of the King George Landfill in August and September 2001, November 2003, and December 2004. Table 10 summarizes the solid waste sampling results from these sampling events. All waste sampling activities performed in December 2004 were conducted under the direction of Geosyntec. No additional data were collected during the current reporting period.

A brief review of the data available through December 2004 yields the following observations:

- the average moisture content has increased by approximately 1 percent in the test area and by approximately 7 percent in the control area; and
- the average pH of the waste samples increased from 6.33 to 7.54 in the test area and from 6.21 to 7.55 in the control area.

Because of the limited amount of solid waste sampling data collected, trends in the data are not identified at this time.

Drawing 1 presents settlement contours for the test and control areas based on the data collected during the 4 January 2004 and 18 April 2005 surveys. In general, the amount of settlement observed in both the test and control areas is relatively consistent. No additional data were collected for the current reporting period.

6. SUMMARY

This report has provided a summary of the monitoring activities conducted between November 1, 2002 and December 31, 2006 at the King George Landfill as part of the leachate recirculation operations conducted under the USEPA's XL Program. The program has been operating for approximately four years. At this time, WMVA does not anticipate continuing bioreactor operations at King George and plans on formally withdrawing from the Final Project Agreement in early 2007. Definitive conclusions related to the performance of the test area at the King George Landfill cannot be provided at this time. However, the following general comments related to the performance and operation of the system at King George are offered.

- The ability to recirculate leachate may be significantly influenced by the composition of the waste. The waste stream at King George during filling of Cells 1 through 10 has included approximately 400 to 600 tons of fly ash per day, which has been used as alternative daily cover soil which may have impacted the ability of leachate to percolate through the waste. Leachate recirculation and bioreactor operations should be minimized at sites that contain a significant amount of fly ash or layers of other potentially impermeable materials in their waste stream.
- Using the operational techniques identified in the Project XL program for King George Landfill, the anticipated benefits (i.e., settlement, improved leachate quality, and improved landfill gas quality) should not necessarily be expected to occur within the first four years after the initiation of bioreactor operations.
- It has been observed that bioreactor operations can be implemented without major impacts (i.e., excessive odors, slope stability problems). However, based on the observed operational issues reported during 2003, the ability to effectively recirculate leachate has been impacted.
- Landfill hydrology (i.e., the flow of liquids within a landfill) can be impacted by a number of factors and is not well understood at this time. Future efforts in the performance of bioreactor systems should attempt to better understand the long term performance of the liquid application system. Once waste is compacted, it becomes more difficult to effectively recirculate leachate and obtain an even distribution of moisture in the waste mass.

TABLE 9
RAINFALL DATA SUMMARY
Project XL
King George County Landfill and Recycling Center
King George County, Virginia

Month	Average Precipitation	2006 Precipitation	Departure from Normal
January	3.3	5.5	2.2
February	3.05	1.36	-1.69
March	4.01	0.06	-3.95
April	3.1	3.51	0.41
May	3.78	2.64	-1.14
June	3.63	2.95	-0.68
July	4.11	1.4	-2.71
August	3.68	1.33	-2.35
September	3.66	5.39	1.73
October	3.47	6.05	2.58
November	3.25	2.25	-1
December	3.39	1.03	-2.36
Total	42.43	33.47	-8.96

Note: The totals for 2006 precipitation and departure from normal are for the year to date.
Rainfall data is for Falmouth, Virginia.

Notes:

This table summarizes the leachate parameters that were detected in Cell 1. Samples where the concentration may be greater than the MCL are show in **bold**.

In some cases, the method detection limit is higher than the MCL.

**Re: King George County Landfill, Permit No. 586
XL Project
JEI Project No. 464.17/Task No. 01/File No. 6.2**

Dear Mr. Lyle:

In accordance with the Site Rule Making Requirements for the XL Project, Joyce Engineering, Inc. has compared the available groundwater monitoring data through June 2006 for the uppermost aquifer compliance monitoring network at the King George County Landfill, Permit No. 586, to the current Maximum Contaminant Levels (MCL) for the constituents that are listed in Table 1 of 40 CFR Part 258.40.

Based on my review, the following constituents in Table 1 of 40 CFR Part 258.40 have been detected at concentrations that exceed the current MCL; however, it is noted that the detected concentrations were less than the facility background concentrations at the time of detection. Subsequently, the concentrations did not represent statistically significant concentrations and the monitoring program at the King George County Landfill, Permit No. 586, was allowed to continue in the Detection Monitoring Program.

Constituent	Current MCL (ug/L)	Sample Location	Sample Date	Monitoring Result (ug/L)
Arsenic	10.0	TW02U	8/8/96	20
		TW06D	6/21/96	33
		TW11D	12/17/02	12
Cadmium	5.0	TW02U	3/18/99	16
			9/8/98	6.4
			3/19/97	12
			12/29/97	9.2
			1/17/97	8.5
			2/13/97	8.4
			9/5/97	7
			12/16/96	14
		TW06D	6/21/96	8.9

Mr. Dean Lyle

Constituent	Current MCL (ug/L)	Sample Location	Sample Date	Monitoring Result (ug/L)
Cadmium	5.0	TW13D	3/19/99	18
			12/17/98	9.5
			6/16/98	6.8
Lead	15.0	TW01U	3/10/03	31
			12/11/00	20
		TW02U	8/8/96	51
			6/21/96	20

Note that the wells designated with the postscript "U" are considered upgradient wells and those with the postscript "D" are downgradient wells at this facility. If you have any questions, please contact me at 804-355-4520.

Sincerely
JOYCE ENGINEERING, INC.

A handwritten signature in black ink, appearing to read "A. Miller". Below the signature, there is a small oval containing the text "Jason Miller" and "Project Consultant".
